Figure S1. $\mathrm{Li}_{2} \mathrm{MO}_{3} R \overline{3} m, C 2 / m$, and $C 2 / c$ unit cells illustrated down the b-axis (top) and corresponding portion of the Li-M layer representing a single hexagon configuration (bottom) with lithium and metal occupying their ideal Wyckoff positions (lithium and metal labeled blue and green respectively). For $C 2 / c$ there are two unique atomic positions to describe M sites within the $\mathrm{LiM}_{2}$ layer, represented as the two different shades of green.

Figure S2. Rietveld refinement of TOF Neutron (Oak Ridge NOMAD BL-1B) diffraction data. The collected data (black cross), Rietveld refinement (red line), and difference (blue line) are presented for each of the four collected banks. Resulting $w R_{p}=6.4 \%$.

Figure S3. Illustration of the $C 2 / c$ honeycomb ring with lithium and osmium sites labeled according to Table 1 with $\mathrm{Os} 3 / \mathrm{Li} 3$, Os4/Li4, and Os5/Li5 octahedral sites as grey, purple, and orange (osmium and lithium labeled green and blue respectively).

## Table S1

| Bond lengths ( $\AA$ ) and angles ( deg ) |  |  |  |
| :---: | :---: | :---: | :---: |
| Li1- O1 | 2.106(9) | Os3(Li3)- $\mathrm{O} 1 \times 2$ | 2.025(4) |
| Li1- O1' | 2.136(9) | Os3(Li3)- $\mathrm{O} 2 \times 2$ | $2.046(4)$ |
| Li1- O2 | 2.187(9) | Os3(Li3) - O3 x 2 | 2.047(4) |
| Li1- O2' | 2.110(9) |  |  |
| Li1-O3 | 2.138(9) | Os4(Li4)- - O x 2 | 2.020(4) |
| Li1- O3' | 2.188(9) | Os4(Li4)- $\mathrm{O} 2 \times 2$ | $2.023(4)$ |
|  |  | Os4(Li4)- O3 $\times 2$ | 2.014(4) |
| Li2-O1 $\times 2$ | 2.175(4) |  |  |
| Li2-O2 x 2 | 2.220(4) | Os5(Li5) - O1 x 2 | 2.005(4) |
| Li2-O3 x 2 | 2.113(4) | Os5(Li5) - O2 x 2 | 2.035(4) |
|  |  | Os5(Li5) - O3 x 2 | 2.010(4) |
| Os3(Li3) - Os4(Li4) x 2 | 2.978(5) |  |  |
| Os3(Li3) - Os5(Li5) x 2 | 2.866(4) | O1-Os3(Li3)- O 2 | 90.50(2) |
| Os3(Li3) - Os5(Li5) | 3.088(9) | O2-Os3(Li3)- O 3 | 175.92(3) |
|  |  | O1-Os4(Li4)- O 2 | 94.46(2) |
|  |  | O2-Os4(Li4)- O 3 | 178.67(3) |
|  |  | O1-Os5(Li5)- O 2 | 94.15(2) |
|  |  | O2-Os5(Li5)- O 3 | 176.06(3) |

## Stacking Fault Modeling

The DIFFaX program requires the cell axes to be defined with the c-axis perpendicular to the fault direction. For a monoclinic space group a new idealized unit cell for each individual layer must therefore be established. The new hexagonal unit cell was defined as $a_{h e x}=a_{C 2 / c}$ and $c_{\text {hex }}=\left[\left(c_{C 2 / c} \times \cos \left(\beta_{C 2 / c}-90\right)\right) / 2\right](z)$, with $z$ as the number of hexagonal layers used for the model. Division of 2 is based on the number of repeating $\mathrm{Li}^{-\mathrm{LiM}_{2}}$ layers within $\mathrm{C} 2 / \mathrm{c}$ unit cell. Layer extension in a- and b-direction was set to infinite. The single layer used in DIFFaX and $\mathrm{Li}-\mathrm{LiOs}_{2} \mathrm{C} 2 / \mathrm{c}$ layer are illustrated in Fig S4. To replicate the ideal stacking sequence of $\mathrm{Li}_{2} \mathrm{OsO}_{3}$ (C2/c), layer sequencing was characterized by $[1 / 3,0,1 / z]$ transition vector $\left(R_{1}\right)$. To replicate stacking fault contribution, transition vectors $[0,1 / 3,1 / z]$ and $[2 / 3,0,1 / z]$ ( $R_{2}$ and $R_{3}$ ) were incorporated. Probabilities were assigned to each of the three transition vectors, with $\alpha_{1}+\alpha_{2}+$ $\alpha_{3}=1$ for each layer. For the latter two transition vectors, there was no tangible difference in the model when varying the contribution for a given total stacking fault probability. Thus for the models presented, the assumption $\alpha_{2}=\alpha_{3}$ was implemented. Fig S 5 shows a comparison of the measured XRD pattern (top black line), along with $0 \%$ site disorder $\mid 0 \%$ stacking fault, $0 \%$ site disorder | $30 \%$ stacking fault, and $50 \%$ site disorder | $0 \%$ stacking fault simulated patterns (blue lines) within 17-35 $2 \theta$ region. With incorporation of stacking faults, only (002) and (020) peaks within $17-352 \theta$ range do not broaden (Fig S6). Similar observations for other DIFFaX modeled $\mathrm{Li}_{2} \mathrm{MO}_{3}$ systems exist [S1, S2, S3]. Calculated XRD patterns with site disorder equivalent to Table 1 without and with $10 \%$ stacking faults are shown in Fig S7. The absence of the (020) peak is therefore attributed to $\mathrm{Li}-\mathrm{Os}$ site disorder within the $\mathrm{LiOs}_{2}$ layers.
